

The Spatium multiservice platform is based on the Spatium Protocol, which eliminates the single point of attack that leaves current wallets so vulnerable – the private key. Instead, pieces of authentication data are spread out among several participating devices and the blockchain and together sign transactions without ever leaving their respective devices. Based on this technology, the company has already released the most secure software wallet on the market, to be followed by a novel hardware wallet, enterprise wallet solution, ICO service, and more components of the multiservice platform that allows users to crypto securely.
